Confutability -> Complexity study of resources needed for Computation How much spac? - the - Randon ress Q1 boes more space in was the power of a TM? (i.e. can it recognize more languages?) 02 Does more time help? Does Nondetermino help? - Randomess helf? Def. A function f: N -> N is said to be space-constructible if 3 TM M that on input 1" outputs f(n) and uses O(f(n)) space, (assuming f(n) = logn) g(n) = O(f(n)): In, c: +n > no, g(n) ≤ Cf(n) g(n) = o(f(n)): + c>o, 7 no: + n > no g(n) < c f(n).

Space (1(n))

Time (C1(n)) TIME (+(n1) = TMs that sun for Lat most t(n) steps SPACE (1(n1) = TMs that use at most S(n) space. The "configuration" of a TM is (a, head position, tape contento) with space s(n) # possible configurations = |Q|. A(n) - |T| $= C_1 \cdot \mathcal{S}(n) \cdot C_2 \cdot C_2$ \leq $\binom{\lambda(n)}{\cdot}$ If it goes longer, then it repeats configurations, i.e. it loops and will not accept.

m	(SPACE HIERARCHY THEOREM)
	for any space constructible function of
· ·	
	I language L that is decided by a TM
	using O(f(n)) space but not by
	am TM rising O(f(n)) stage.
	any TM using o(f(n)) space.
P-F	
	(M ₂)
	$\langle M_1 \rangle$
	And the control of the contr
	(M_1) (M_2) (M_2) $= \begin{cases} 1 & \text{M accepts } x \text{ Moving } \leq f(n) \\ \text{space and } \leq f(n) \text{ trie.} \end{cases}$ $0 & \text{otherwise}$
	D1: 1 School Min at M
	Define $L_f = \{ (M), 1^n \mid M \text{ is } a \perp M \}$ M on (M) does not accept
	Iving abase & from and
	Maring space ≤ f(n) and The ≤ 2 f(n)
	Me = 2
	Clam 1. 3 TM D that decides Ly using
	Apace O(f(n)).
	1. Mark f(n) space on the take
7	
D	on input 2. If M this to use more legical (M), in 2 To the used is 2 of (n) legical
	3. It me man 2 repes
	4-1- he is Macapto, reject;
	4. Else if Maccepto, rejet; in Mujecto, accept.
	,

	Claim 2. No TM wang O(f(n)) &pace
	can decide L _f .
	Suppose 3 such a TM M.
	What happens when D is sun on <m>, In</m>
	Daccepts (M) if M rights (M)
Sno	- rejects <m> if Macopts <m>. LD + LM. Contradiction!</m></m>
	FRI: TIME HIERARCHY THEOREM
	Nondeterninism.
	NTM. Q, S, T, Postat, Parcett, Priget. 8: QxT -> (QxT) x {L,R}
	$\delta(q,a) \longrightarrow \{(q,q_1,L),(q_2,q_2,L),(q_3,q_3,R),\ldots\}$
	NTM accepts input w if I a sequence of transitions Met lead to vaccept.
	DTM computation is a path, ending in accept/hexat or going NTM — is a Thee: if any leak is fraver. an acoust, The injut is accepted:
	The NTIME (t(n)) C TIME (ct(n))
	Nondetominism due not charge the set of accepted languages.
	of accepted languages. Pf- Breadth-First Search

NTIME = Depth of the
DTIME = Size of thee.
NTMs can guess an "accepting path" and check it.
Examples FACTORING
FINDING S-t paths
Ham cycles
What about space?
If an NTM takes Apace A(n)
What will a DTM take?
C S(M) ? this is as much trie as it could take. If each steps. takes Mp Some space, then
Specific Problem: 3 path in a from stot?
V =n, then NTM needs O(logn) Age
(ques rext vertex)
What about DTM? BFS, DFS?

```
Thm (SAVITCH)
        NSPACE (D(n)) \subseteq DSPACE (D(n)^2)
       heaph conectints & DSPACE (Ollogn).
        PATH (a, b, k):
            If K=0: if a=b: accept else reject.
            If K=1: if (a,b) \in E: accept, else right
               For each C = a, b in V:
                TIF PATH (a, c, [*]) accepto
               and PATH (c, b, [k]) accepts
               then accept.
              Reject
  PATH (a,b, K) accepts of I path of length < K
              between a and b in h= (V, E)
               rejects otherwise.
   Space used: O(logn) per level of reaution to store the name "C".
      + levels of recusion = log K \le log n
       : total space = O(\log^2 n).
```

PF (of Santah)
Consider graph of all possible
configurations $[V] = [Q] \times \Delta(n) \times C^{\Delta(n)}$
If I path from Start config to end config,
it is of largth \(\le V -1
space reeded by a DTM = O(log2/VI)
$= \mathcal{O}\left(\left(\Delta(n) + \log(\Delta(n))\right)^{2}\right)$
$= O(\lambda(n)^2).,$
This hard has been inproved for
indirected grafter consectints, namely
UCONN can be solved using.
· ·
space O(logn) [REINGOLD]
cons can be solved
with Randonnes in space O(logn).
